The invention describes a method of diagnosing breast cancer in subject comprising contacting biological sample from subject with at least two different breast cancer-associated polypeptides (I) encoded by nucleic acid molecules (II) comprising sequence chosen from 42 fully defined sequences as given in specification, determining specific binding between (I) and agents in sample, where presence of the binding is diagnostic for breast cancer. The method is useful for diagnosing breast cancer in a subject. The sample is blood, lymph node fluid or breast discharge fluid. This is the amino acid sequence of a breast cancer antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               71 LFSFESGRKCQTGQGIFAFKCARAEELFNMLQEIMQNNSINVVEEPVVERNNHQTELEVP 130

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence represents the amino acid sequence of human suc-1-associated neurotrophic factor target protein (SNT-1). The invention provides fragments of SNT and fibroblast growth factor receptor (FGFR) which form a binding complex that is amenable to structural determinations by muclear magnetic resonance (NMR) spectroscopy. The invention provides methodology for related structure based rational drug design using the three-dimensional data. The invention fulfills the need for the determination of the three-dimensional structure of such complexes as described and for procedures for related structureal base drug design predicated on such structural data

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RTPRTPTTPG 140
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gout I,
```

Sequences ABB19381-ABB12310 represent 1350 novel human polypeptides, and sequences ABB19381-ABB12310 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the nucleotides.

CC antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which cor polypeptides of the invention. Although novel, many of the which polypeptides of the invention have homology to known proceins, thereby giving an insight into their probable biological activities, and hence complications activities; including cytokine, cell proliferation or cell ferentiation activities; including cytokine, cell proliferation or cell mannomodulatory activity; tissue growth activity; chemological activities; nemotocial activities may be used to promote wound are activities may be used in the treatment of viral, becreail and fungal infections includes with activities may be used to convected and inductory activities may be used not polypeptid ameliorating a medical condition in a mammalian subject e.g. arthritis screening techniques. The present sequence represents a novel human polypeptide of the invention Claim 20; Page 261; 1963pp; English. screening

Sequence 521 AA;

Fibroblast growth factor receptor protein kinase substrate 2 (FRS2).

```
The present sequence represents an adaptor protein linking protein kinases to activating partners in cells. The protein is designated fibroblast growth factor receptor protein kinases substrate 2 (FRS2). It requilates the growth factor protein of cellular differentiation and cellular proliferation by linking stimulated fibroblast growth factor receptor to the Rass/MAPK cascade via Grb-2/Sos complex. The FRS2 protein is useful to diagnose abnormal conditions associated with cell proliferation or cell differentiation in organisms caused by an aberration in a signal transduction pathway characterised by an interaction between a FRS2 plyperide and a natural binding partner (especially in mammals). Such abnormal conditions can be associated with cell proliferation or cell differentiation. The protein is also useful to identify compounds that enhance or block FRS2 interactions with natural

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HIA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated cancer associated nucleic acids and polypeptides - isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers.
                                                                                 associated antigen; diagnosis; research; treatment; human; cancer; colon cancer; gastric cancer; renal cancer; lung cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DTVPDNHRNKFKVINVDDDGNELGSGIMELTDTELILYTRKRDSVKWHYLCLRRYGYDSN

                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL10511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS737-ABB72072). The sequence data for this parent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                             New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

The present sequence represents p62-dok (protein downstream of tyrosine mammasian cells after stimulation with a ligand for a receptor tyrosine kinase found in oncogenic cells. The p62-dok protein binds p120 ras GTPase-activating protein (GAP). The p62-dok protein binds p120 ras GTPase-activating protein (GAP). The p62-dok protein is involved in a signal transduction pathway initiated by receptor tyrosine kinase, and is rapidly tyrosine phosphorylated. The p62-dok protein is also present in normal cells, but is not constitutevely phosphorylated by normal receptor tyrosine kinase. Antibodies against p62-dok and aberrantly phosphorylated 62-dok, and probes derived from the p62-dok mase event in the diagnosis and treatment of conditions in which an oncogenic tyrosine kinase is active such as chronic myelogenous leukaemia (CML) and other

The present invention describes a predictor set comprising a plurality of polymucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase activity or members of the protein tyrosine kinase to pathway. Also described: (1) predicting whether a compound is capable of conformating whether the cells, comprising obtaining a sample of cells, correlating whether the cells express a plurality of markers, and correlating the expression of the markers to the compound's ability to correlate with compound sensitivity or resistance of cells associated with a disease state, and (3) identifying polymucleotides and collypeptides whose expression levels correlate with compound sensitivity or resistance of cells associated with a disease state, comprising subjecting the plurality of associated with a disease state, comprising subjecting the plurality of an increarray of polymucleotides or polypeptides, and selecting compounds, analysing the expression pattern of a microarray of polymucleotides that predict the sensitivity or resistance of cells associated with a disease state by using the expression pattern of cells associated with a disease state by using the expression pattern of cells associated with a disease state by using the expression pattern of the microarray. The polymucleotides and cells expression pattern of the microarray of polymorphical with a disease state by using the expression pattern of the microarray. The polymucleotides and cells associated with a disease state by using the expression pattern of the microarray. The polymorphical subjection is an even or more companions, and selecting the prediction of cells associated with a disease state by using the expression pattern of the microarray. The polymorphical subjections and conformations and conformations and conformations and conformations and conformations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 259
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The polynucleotides and polypeptides are useful in predicting the activity of compounds that interact with protein tyrosine kinases and/or protein tyrosine kinases and/or sensitivity in patients to allow the development of individualized sensitivity in patients to allow the development of individualized cancer; based on patient response at a molecular level. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            24 GSGIMELIDIELILYTRKRDS-----VKWHYLCLRRYGYDSNLFSFESGRRCOTGOGIF

```

The invention relates to an isolated polypeptide that comprises a sequence with 60 % sequence identity to one of 103 prostate specific cepted by a nucleic acid comprising one of 114 prostate specific mucleic concoded by a nucleic acid comprising one of 114 prostate specific mucleic acid (PSNA) sequences (S2), given in specification. Also included are a vector comprising the PSNA, a host cell comprising the vector, and the PSNA, a host cell comprising the vector of the PSNA, a host cell comprising the vector of the PSNA, a host cell comprising the vector of the PSNA, and a vector comprising the presence of cancer in a patient, comprising a unit for and a vaccine comprising the PSP or the PSNA, in a sample of a patient and a vaccine comprising the PSP is useful for determining the presence of a prostate specific nucleic acid (PSNA) in a sample. The antibody to the PSP is useful for determining the prostate cancer, where the administration of the antibody induces an immune response against the prostate cancer cell carting a patient with prostate cancer, where the administration of the antibody induces an immune response against the prostate cancer cell carting the nucleic acid molecule or polypeptide. The PSPP or the PSNA is useful for dagnosing and monitoring the presence and metastases of prostate cancer in a patient. The PSN is useful for identifying an agonist and antagonist. The PSNA is useful for detecting prostate cancer by detecting genetic lesions or mutations. The PSP and the PSNA are useful for detecting genetic lesions or mutations. The PSP and the PSNA are useful for detecting genetic lesions or mutations. The PSP and the PSNA are useful for detecting genetic lesions or mutations. The PSP the PSPA the cancer where the pSPA and the PSNA are useful for detecting genetic lesions or mutations. The PSP the PSPA the PSNA and the antibody are useful for identifying prostate cancer. The PSP and the PSNA are useful for detecting genetic lesions or mutations. The PSP the PSPA the pSNA and the antibody are usefu diagnosing, monitoring, staging, imaging and treating prostate cancer and non-cancerous disease states in prostate tissue. The present sequence is a prostate specific protein (PSP) sequence

The present sequence is that of a mouse haematopoietic stem cell (HSC) specific protein. It is an example of claimed HSC specific proteins (see AAY29176-93) predicted from movel isolated HSC specific nucleic acids (see AAZ94077-111). The HSCS are especially primitive HSCS (PHSCS) such as umbilical cord cells, bone marrow cells and foetal liver cells. The encoded proteins are growth factors, transcription factors, splicing factors, transport proteins, translation factors or replication factors. The invention provides claimed methods: CC differentiation or replication. The invention provides claimed methods: CC in a sample in for identifying PHSC specific nucleic acids, for generating a stem coll/progenitor cell from PHSCs; for identifying the presence of a PHSC in a sample in for identifying the presence in a sample of a compound that modulates HSC activity; for using such a compound to treat an immune system condition, especially leukaemia; for introducing exogenous nucleic acidinto a HSC; and for ex vivo expansion of HSCs Also claimed are vectors, host cells, and an antibody that specifically binds a an HSC-specific protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     --EPVVERNNHOTELEVPRTPR 124

NOVX sequences can have cytostatic, antidiabetic, neuroprotective, antiparkinsonian and anorectic activities, and can be used in vaccines and gene therapy. The NOVX polypeptides can be used for preparing a composition for treating or preventing a pathology associated with the NOVX-polypeptides e.g. cancer, neurodegenerative disorders such as Parkinson's disease, or metabolic disorders such as diabetes or obesity, or for tissue typing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New NOVX polypeptide, useful for preparing a composition for treating or preventing e.g. cancer, neurodegenerative disorders such as Parkinson's disease in metabolic disorders such as diabetes or obesity, or for tissue typing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Catterton E;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-brager Syndrome. Other uses include the utilisation of the activities such as immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic auch therapy, drug screening, and thrombolytic activity, cancer diagnosis and therapy, drug screening,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human nucleic acids (AAIS7799-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous

system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic as througholytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders. Note: The sequence data for this patent did not form part of the printed specification

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymuclectides are useful in gene therapy. A composition containing a polypeptide or polymuclectide of the invention may be used to treat diseases of the peripheral nervous sipturies, peripheral nervous injuries, such as localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic cateriosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolyty cateriotity, cancer diagnosis and therapy, drug screening, assays for receptor activity, ancer diagnosis and inflammation, leukaemias and CNNS disorders. Note: The sequence data for this patent did not form part of the printed specification

CC human secreted proteins AABS2012 - AABS2161. Sequences AABS2062 - AABS2103 represent alternative polypeptides encoded by the genes, and amino acid sequences with which they share homology. The genes and proteins have activities dependent on the tissues and cells in which they care expressed. Examples of their activities include cytostatic; are expressed. Examples of their activities include cytostatic; aminousuppressive, nootropic, neuroprotective, antiviral, antiallargic; hepatotropic; antidabetic; antiinflammatory; antiviral, antiallargic; anticonvulsant; antibacterial; antiinflammatory; antiviral; and cardiant. The secreted proteins, polypeptides, antagonists and agonists may be anticonvulsant; antibacterial; antifundary diseases and disorders cuseful in treating, preventing and/or diagnosing diseases and disorders such as cancer; particularly breast and ovariant cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, lung, or urogenital. Immune disorders such as Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, cardiovascular disorders such as myocardial ischaemias; wound healing; neurological diseases such as myocardial ischaemias; wound healing; neurological diseases such as creebral anoxia and epilepsy; and infections may also be treated using the proteins and polynucleotides of the invention. Sequences AAC95512 - AAC95520 and AABS2011 are used in the isolation and characterisation of the proteins and polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            47 WHYLCLRRYGYDSNLFSFESGRRCQTGQGIFAFKCARAEELFNMLQEIM--QNNSINVVE 104

A,Molecule type: protein appears to be the major substrate for insulin-stimulated tyrosine C,Comment: This protein appears to be the major substrate for insulin-stimulated tyrosine o dock various proteins containing the phosphotyrosine-binding Src-homology domain 2 (SH. C,Comment: This protein contains at least 11 PEST regions, which suggests rapid turnover.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A map position: 2436-2436

A; Note: the phosphotyrosine residue was not identified
C; Comment: This protein and the beta chain of the insulin receptor itself are the major
C; Comment: Phosphorylation of this protein in response to insulin is maximal at 30 secon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        an

Docking protein 1 (p62(dok)) (Downstream of tyrosine kinase 1) (pp62).
                                                                                                                 -!- PTM: Constitutively tyrosine-phosphorylated (By similarity).
-!- PTM: Phosphorylated on tyrosine residues by the insulin receptor kinase. Results in the negative regulation of the insulin signaling pathway (By similarity).
-!- SIMILARITY: BELONGS TO THE DOK FAMILY.
-!- SIMILARITY: Contains 1 PH domain.

-!- FUNCTION: Docking proteins interact with receptor tyrosine kinases and mediate particular biological responses. May modulate the cellular prolliferation induced by IL-4, as well as IL-2 and IL-3.

-!- SUBUNIT: Interacts with RasGAP, TEK/TIE2 receptor and EGF receptor. Interacts with RET.

-!- TISSUE SPECIFICITY: Expressed in lung and spleen.

-!- DOMAIN: PTB domain mediates receptor interaction.

-!- PTM: Tyrosine phosphorylated.

-!- SIMILARITY: Contains 1 PTB domain.
                                                                                                                                                                                                                                                                                                                     INTERACTION WITH RET.

-!-FUNCTION: Docking proteins interact with receptor tyrosine kinases and mediate particular biological responses. Functions in RET-mediated neurite outgrowth and plays a positive role in activation of the MAP kinase pathway. Putative link with donwstream effectors of RET in neuronal differentiation (By similarity).
-!-SUBWIT: Interacts with phosphorylated RET. In contrast to other DOK proteins, it does not interact with RASGAP (By similarity).
-!-ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isola-g9P104-2; Sequence=VSP 003854;
Note=No experimental confirmation available;
Note=No Bomain mediates receptor interaction (By similarity).
SIMILARITY: BELONGS TO THE DOX FAMILY.
SIMILARITY: Contains 1 PH domain.
SIMILARITY: Contains 1 PTB domain.

I. Biol. Chem. 268:18157-18166(1993).
I. FUNCTION: May mediate the control of various cellular processes by insulin. When phosphorylated by the insulin receptor binds specifically to various cellular proteins containing SH2 domains such as phosphatidylinositol 3-kinase p85 subunit or GRB2.
I. SIMILARITY: Contains I PH domain.
I. SIMILARITY: Contains I PTB domain.

Biophys. Acta 1172:323-326 (1993).
-!- FUNCTION: May mediate the control of various cellular processes by insulin. When phosphorylated by the insulin receptor binds specifically to various cellular proteins containing SH2 domains such as phosphatidylinositol 3-kinase p85 subunit or GRB2.
-!- SIMILARITY: Contains 1 PH3 domain.
                                                                                       Gaps

Structural basis for IL-4 receptor phosphopeptide recognition by the IRS-1 PTB domain.";
Nat. Struct. Biol. 3:388-393(1996).

-!- FUNCTION: May mediate the control of various cellular processes by insulin. When phosphorylated by the insulin receptor binds specifically to various cellular proteins containing SH2 domains such as phosphatidylinositol 3-kinase p85 subunit or GRB2.
-!- DISEASE: POLYMORPHISMS IN IRS1 MAY BE INVOLVED IN THE ETIOLOGY OF A SUBSET OF LATE-ONSET NON-INSULIN-DEPENDENT DIABETES MELLITUS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    VARIANTS NIDMM TYR-1043 AND TYR-1085.

"Genome sequence of Vibrio parahaemolyticus: a pathogenic mechanism
distinct from that of V. cholerae.";
Lancet 361:743-749(2003).

-!-FUNCTION: Catalyzes the synthesis of dihydrouridine, a modified
base found in the D-loop of most tRNAs (By similarity).
-!- COFACTOR: FAD (By similarity).
-!- SIMILARITY: Belongs to the dus family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bacteria; Proteobacteria; Gammaproteobacteria; Vibrionales;

Sequence 4, Application US/08531439B

Patent NO. 5981702

GENERAL INFORMATION:
APPLICANT: Zhang, Hui
APPLICANT: Zhang, Hui
APPLICANT: Zhang, Hui
APPLICANT: Aboutd
TITLE OF INVENTION: O'Cyclin/CDK Associated Proteins,
TITLE OF INVENTION: and Uses Related Thereto
NUMBER OF SEQUENCES: 18
CORRESPONDENCE ADDRESS:
ADDRESSE: Foley, Hoag & Eliot
STAEET: One Post Office Square
CITY: Boston
STATE: MA
COUNTY: USA
COMPUTE: IBM PC compatible
COMPUTER: IBM PC compatible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match 11.1%; Score 77; DB 3; Length 38; Best Local Similarity 40.6%; Pred. No. 0.016; Matches 13; Conservative 9; Mismatches 10; Indels
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC COMPAtible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Rclease #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/787,091
FILING DATE:
